

CHEMISTRY-IX

CHAPTER-1

Matter in our surroundings

Presented By-
Mallikharjuna Gonu
PGT(CHEMISTRY)

Instructions:

- Go through the complete video for the complete lesson.
- Please click on the given icons in this slide for the videos and animations.
- Students are requested to take class notes which is given in the following slides.

Video part

matter in our
surroundings

MATTER

**EVERYTHING IN THIS
UNIVERSE IS MADE UP
OF MATERIAL CALLED
MATTER.**

PROPERTIES OF MATTER

- Matter is any things which occupies mass and have space.
- Each matter is a collection of lots of tiny particles.
- Particles of matter are continuously moving.

PROPERTIES OF MATTER

- Matter is any things which occupies mass and have space.
- Each matter is a collection of lots of tiny particles.
- Particles of matter are continuously moving.

PHYSICAL NATURE OF MATTER

- ▶ The particles of matter are very tiny.
- ▶ The particles of matter have space between them.
- ▶ The particles of matter are continuously moving.
- ▶ The particles of matter attracts each other.

THE PARTICLES OF MATTER ARE VERY TINY :-

Activity :- Dissolve 2 – 3 crystals of potassium permanganate in 100ml of water in a beaker. Then Take 10ml of this solution and dissolve in 100ml of water. Take 10ml of this solution and dissolve in 100ml of water. Repeat this process 5 – 6 times. This shows that a few crystals of potassium permanganate can color a large volume of water because there are millions of tiny particles in each crystal.

The particles of matter have space between them :-

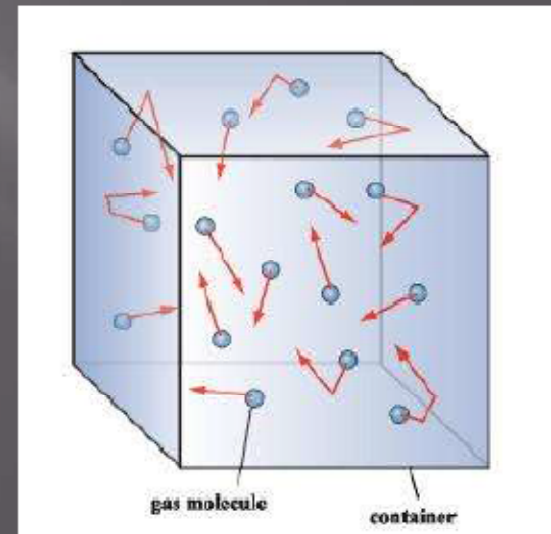

Activity :- Take some water in a beaker and note its level. Dissolve some salt or sugar in it with the help of a glass rod. The salt dissolves in the water but the level of water does not change. This is because the particles of salt get into the space between the particles of water.

PARTICLES OF MATTER ARE CONTINUOUSLY MOVING :-

Activity :- Take some water in a beaker and put a drop of blue or red ink slowly along the sides of the beaker. Leave it undisturbed for a few hours. The ink spreads evenly throughout the water due to the movement of the particles of water and ink.

The intermixing of two or more different types of matter on their own is called diffusion.

Particles of matter attract each other :-

Activity :- Take an iron nail, a piece of chalk and a rubber band. Try breaking them by hammering, cutting or stretching. It is more easier to break the chalk, less easier to break the rubber band and difficult to break the iron nail. This is because the particles in the iron nail are held together with greater force than in the rubber band or chalk.

MATTER AROUND US IS EXISTS IN THREE STATE, THEY ARE:-

THE SOLID STATE

Properties of solids :-

- Solids have definite shapes and fixed volume.
- The space between the particle is minimum.
- The force of attraction between the particles is maximum.
- The movement of the particles is minimum.
- They are least compressible.
- Their rate of diffusion is least.

THE LIQUID STATE

Properties of liquids :-

- Liquids have no definite shape but have fixed volume. Liquids take the shape of the container.
- The space between the particles is intermediate.
- The force of attraction between the particles is intermediate.
- The movement of the particles is intermediate.
- They are less compressible.
- Their rate of diffusion is more than solids.

GASEOUS STATE

GASEOUS STATE

Properties of gases :-

- Gases have no definite shape or fixed volume. Gases occupy the whole space of the container.
- The space between the particles is maximum.
- The force of attraction between the particles is minimum.
- The movement of the particles is maximum.
- They are most compressible.
- Their rate of diffusion is more than solids and liquids.

CHANGE OF STATE :-

WHEN A SOLID IS HEATED IT CHANGES INTO LIQUID. WHEN A LIQUID IS HEATED IT CHANGES INTO GAS.

WHEN A GAS IS COOLED IT CHANGES TO LIQUID. WHEN A LIQUID IS COOLED IT CHANGES INTO SOLID.

EG:- IF ICE IS HEATED IT CHANGES INTO WATER. IF WATER IS HEATED IT CHANGES INTO STEAM. IF STEAM IS COOLED IT CHANGES INTO WATER. IF WATER IS COOLED IT CHANGES INTO ICE.

▲ Changes of state in matter.

SUBLIMATION :-

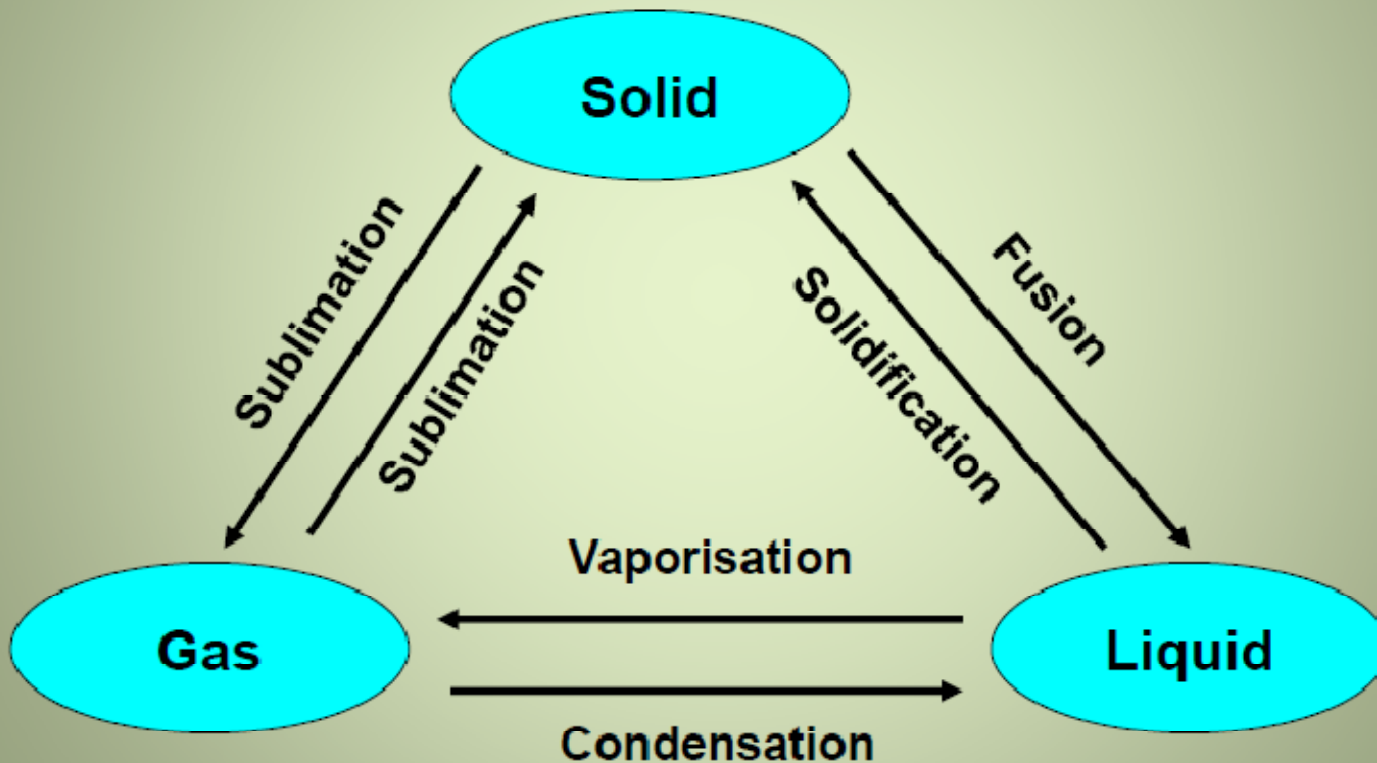

The change of state directly from solid to gas or from gas to solid is called sublimation.

E.g. :- If solid camphor or ammonium chloride is heated, it changes into vapour. If the vapours are cooled it changes into solid.

INTERCONVERSION OF THE THREE STATES OF MATTER :-

The states of matter are inter convertible. The state of matter can be changed by changing the temperature or pressure.

EFFECT OF PRESSURE ON GASES :-

When pressure is applied on gas the particles come closer and the gas changes into liquid.

We can liquefy gases by applying pressure and reducing the temperature.

Compressed solid carbon dioxide is called dry ice. If the pressure is reduced it changes directly to gas without coming into liquid state. So solid carbon dioxide is known as dry ice.

Evaporation :-

The change of a liquid into vapour at any temperature below its boiling point is called evaporation.

Evaporation is a surface phenomenon. Particles from the surface gain enough energy to overcome the forces of attraction and changes to vapour state.

Factors affecting evaporation :-

- ❖ The rate of evaporation depends upon surface area, temperature, humidity and wind speed.
- ❖ Increase in the surface area increases the rate of evaporation.
- ❖ Increase in temperature increases the rate of evaporation.
- ❖ Increase in humidity decreases the rate of evaporation.
- ❖ Increase in wind speed increases the rate of evaporation.

EVAPORATION CAUSES COOLING :-

When a liquid evaporates, the particles of the liquid absorb heat from the surroundings and evaporates. So the surroundings become cold.

E.g. :- People sprinkle water on the roof or open ground because during evaporation water absorbs heat makes the hot surface cool.

During summer we sweat more because during evaporation the sweat absorbs heat from our body making the body cool.

Wearing cotton clothes in summer keeps us cool because cotton absorbs sweat and when the sweat evaporates it absorbs heat from our body making the body cool.

How Evaporative Cooling Works

The image has a blue monochromatic theme. In the background, there is a complex molecular structure with various rings and bonds. Scattered throughout are several translucent, glowing spheres of varying sizes, some with bright highlights. At the bottom, there are curved, overlapping shapes in shades of blue and white, resembling a stylized wave or a ribbon. The text 'THANK YOU' is centered in a bold, dark blue font.

THANK YOU
